

Report Mounjaro® - tirzepatide

Product & Mechanism of action	Authorized indications Licensing status	Essential therapeutic features	NHS impact																																								
<p>Substance: tirzepatide</p> <p>Brand Name: Mounjaro</p> <p>Originator/licensee: Eli Lilly Nederland B.V.</p> <p>Classification: NCE</p> <p>ATC code: A10B</p> <p>Orphan Status: Eu: No Us: No</p> <p>Mechanism of action: tirzepatide is a dual GIP and GLP-1 receptor agonist. By means of its action on these receptors, tirzepatide improves glycaemic control through several different mechanisms [1].</p>	<p>Authorized Indication: EMA: tirzepatide is indicated for the treatment of adults with insufficiently controlled T2DM as an adjunct to diet and exercise:</p> <ul style="list-style-type: none">- as monotherapy when metformin is considered inappropriate due to intolerance or contraindications;- in addition to other medicinal products for the treatment of diabetes. <p>FDA: is a glucose-dependent insulinotropic polypeptide (GIP) receptor and glucagon-like peptide-1 (GLP-1) receptor agonist indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus [2].</p> <p>Route of administration: SC</p> <p>Licensing status EU CHMP P.O. date: 21/07/2022 FDA M.A. date: 13/05/2022</p> <p>EU Speed Approval Pathway: No FDA Speed Approval Pathway: Yes</p> <p>-----</p> <p>ABBREVIATIONS: AE: Adverse Event BMI: body-mass index CHMP: Committee for Medicinal Products for Human Use DPP-4: dipeptidyl peptidase-4 GI: gastrointestinal GIP: glucose-dependent insulinotropic polypeptide GLP-1: glucagon-like peptide 1 HbA_{1c}: glycated haemoglobin M.A.: marketing authorization Pbo: placebo P.O.: Positive Opinion Pts: patients SGLT2: sodium glucose co-transporter 2 T2DM: type 2 diabetes mellitus TEAE: Treatment Emergent Adverse Event Vs: versus</p>	<p>Summary of clinical EFFICACY: <u>SURPASS-1</u> (NCT03954834) is a phase III, randomized, double-blind, placebo-controlled trial to compared the efficacy and safety of three tirzepatide doses vs pbo in pts aged ≥ 18 yrs with T2D, inadequately controlled with diet and exercise alone and naïve to injectable diabetes therapy. The eligible pts had an HbA_{1c} of 7% or more (≥ 53 mmol/mol) to 9.5% or less (≤ 80 mmol/mol) at screening. The primary endpoint was the mean change in HbA_{1c} from baseline at 40 weeks. Pts (N=705) were randomly assigned (1:1:1) to received tirzepatide 5 mg (N=121), tirzepatide 10 mg (N=121), tirzepatide 15 mg (N=121), or pbo (N=115), once a week for 40 weeks. More pts on tirzepatide than on pbo met HbA_{1c} targets of less than 7.0% (<53 mmol/mol; 87–92% vs 20%) and 6.5% or less (≤48 mmol/mol; 81–86% vs 10%) and 31–52% of pts on tirzepatide versus 1% on placebo reached an HbA_{1c} of less than 5.7% (<39 mmol/mol) [3].</p> <table><tr><th></th><th>Mean HbA_{1c} decreased from baseline</th><th>Treatment difference versus placebo (p<0.0001)</th></tr><tr><td>Tirzepatide 5mg</td><td>1.87% (20 mmol/mol)</td><td>-1.91% (-21 mmol/mol)</td></tr><tr><td>Tirzepatide 10mg</td><td>1.89% (21mmol/mol)</td><td>-1.93% (-21 mmol/mol)</td></tr><tr><td>Tirzepatide 15mg</td><td>2.07% (23 mmol/mol)</td><td>-2.11% (-23 mmol/mol)</td></tr><tr><td>PBO</td><td>+0.04% (+0.4 mmol/mol)</td><td>/</td></tr></table> <p>Summary of clinical SAFETY: The proportion of pts reporting any AEs and SAEs were similar between groups [3].</p> <table><tr><th></th><th>Tirzepatide 5mg</th><th>Tirzepatide 10mg</th><th>Tirzepatide 15mg</th><th>PBO</th></tr><tr><td>Pts with ≥1 TEAE*</td><td>83 (69%)</td><td>81 (67%)</td><td>77 (64%)</td><td>76 (66%)</td></tr><tr><td>SAEs</td><td>5 (4%)</td><td>2 (2%)</td><td>1 (1%)</td><td>3 (3%)</td></tr><tr><td>Study drug discontinuation***</td><td>4 (3%)</td><td>6 (5%)</td><td>8 (7%)</td><td>3 (3%)</td></tr><tr><td>Deaths</td><td>0</td><td>0</td><td>0</td><td>1 (1%)</td></tr></table> <p>*The most frequent TEAEs (occurring in ≥5 pts) with tirzepatide were: nausea (12%; 13%; 18% vs pbo 7%), diarrhoea (12%; 12; 14% vs pbo 8%), vomiting (3%; 2%; 6% vs pbo 2%); and were mild to moderate in severity and decreased over time in all groups. ***due to gastrointestinal AEs.</p> <p>Ongoing studies:</p> <ul style="list-style-type: none">● For the same indication: Yes● For other indications: Yes <p>Discontinued studies (for the same indication): No</p> <p>References: [1]. https://www.ema.europa.eu/en/medicines/human/summaries-opinion/mounjaro [2]. https://www.accessdata.fda.gov/drugsatfda_docs/label/2022/215866s000lbl.pdf [3]. https://www.thelancet.com/journals/lancet/article/PIIS0140-6736(21)01324-6/fulltext [4]. https://www.portalediabete.org/epidemiologia-del-diabete/ [5]. https://www.io.nihr.ac.uk/wp-content/uploads/2022/01/28192-Tirzepatide-for-Type-2-Diabetes-Mellitus-V1.0-FEB2020-non-CONF.pdf [6]. https://adisinsight.springer.com/drugs/800045287 [7]. https://www.clinicaltrials.gov/</p>		Mean HbA _{1c} decreased from baseline	Treatment difference versus placebo (p<0.0001)	Tirzepatide 5mg	1.87% (20 mmol/mol)	-1.91% (-21 mmol/mol)	Tirzepatide 10mg	1.89% (21mmol/mol)	-1.93% (-21 mmol/mol)	Tirzepatide 15mg	2.07% (23 mmol/mol)	-2.11% (-23 mmol/mol)	PBO	+0.04% (+0.4 mmol/mol)	/		Tirzepatide 5mg	Tirzepatide 10mg	Tirzepatide 15mg	PBO	Pts with ≥1 TEAE*	83 (69%)	81 (67%)	77 (64%)	76 (66%)	SAEs	5 (4%)	2 (2%)	1 (1%)	3 (3%)	Study drug discontinuation***	4 (3%)	6 (5%)	8 (7%)	3 (3%)	Deaths	0	0	0	1 (1%)	<p>Cost of therapy: Price is not available yet.</p> <p>Epidemiology: The prevalence of T2D is steadily increasing due to the rise in obesity and sedentary lifestyle. In Italy, the prevalence of the disease is around 3-4% [4].</p> <p>-----</p> <p>POSSIBLE PLACE IN THERAPY NICE recommends metformin in pts, who can tolerate it. If triple therapy with metformin and two other oral drugs is not effective, not tolerated or contra-indicated then a GLP-1 receptor agonist may be prescribed as part of a triple combination regimen with metformin and a sulfonylurea. In pts who cannot tolerate metformin, drug treatment to be offered is one or a combination therapy of the following: a DPP-4 inhibitor, pioglitazone, sulfonylurea, SGLT2 inhibitor, repaglinide [5].</p> <p>OTHER INDICATIONS IN DEVELOPMENT: Cardiovascular disorders, heart failure, Obesity, Sleep apnoea syndrome [6].</p> <p>SAME INDICATION IN EARLIER LINE(S) OF TREATMENT: No</p> <p>OTHER DRUGS IN DEVELOPMENT for the SAME INDICATION Lixisenatide, HSK7653, PB-119 [7].</p> <p>*Service reorganization: No *Possible off label use: Yes</p>
